Restores
Journal
Book default
High leverage up to a size, less above it. The steps have to go up in volume and down in leverage, and the last one has to be open-ended — a ladder with a hole in it leaves an account on whatever it already had, which is the opposite of a policy.
Publish this ladder
Switched on, the terminal shows it to clients asking why their leverage is what it is. Switched off, nothing here is published and nothing is applied on its own either way.
Open volume
Leverage
No ladder yet. Add a step — an empty list is legal and means "no ladder"; it never means leverage zero.
Add a step
Note
optional — what this ladder is for
Per instrument class
Keyed by the category the symbol catalogue reports — Forex, Metals, Crypto. Every ladder that has something to say answers, and the lowest answer is applied: 50 lots of EURUSD and 50 lots of Bitcoin are not the same risk, and an MT5 account is one number.
Crypto
Add a class ladder
What a volume earns
reads the ladder · writes nothing
2
Crypto — blank asks the book-wide ladder
Read it

Risk Dashboard

The whole book as your gateway adds it up: what the brokerage is carrying by symbol and by class, who is carrying it, how close the exposed accounts are to a margin call, which of your own limits are breached — and the statistics of all of it, live beside a period.

no limits set | Refresh

What these numbers do not cover
The client book is 9427.32s old — the trading backend did not answer the last refresh. Exposure is current; balance, equity and group figures are as of 2026-09-21T13:23:40Z.

no limits set | Net exposure **+19,372,309** long | Gross exposure **21,184,850** | Positions **116** | Clients **23**/ 424 | Breaches **0**

Anti Fraud
Every kind of illegitimate trading and account behaviour on one desk: the gateway's detectors over the real book, the cases they raise, the measures a person takes, and the statistics that say whether the desk is winning. A figure this server cannot supply is a dash with its reason, never a zero.

A surface that is off is hidden from traders and nothing else: the desk behind it keeps running, and its licence is a separate question answered under Platform. Five of these are tabs across the top of the terminal; Bonuses and Swap-free are sections of the account zone, beside the client's own balance. Each switch lives on the screen it belongs to. Last changed by honorprohub:admin@brk_testhonorprohub-brokerag_b5aeab.local on 2026-08-27 12:31.

A mandate is a manager's authority over a set of client accounts — what each account's size is derived from, and what the manager is paid for running it. The copying itself is the copy engine's; a mandate is the policy over it, and only a push reaches anybody's account.

Trading contests: a metric, a window, an entry rule and a prize table. Scores are measured against equity frozen at the start, with funding netted out — and the prizes are paid from here, once, after a rehearsal.

Prop Challenges
What is on sale, who is trading it, how close each attempt is to its target and to each of its two floors — and the keys the storefront authenticates with. Prices are recorded here and charged nowhere: taking the money is the shop's job.
9 on sale
Run the cadence now
Refresh
Show the Prop Firm tab in the client terminal
Hidden, the desk goes on exactly as now — it is a client-terminal switch, not a licence. On needs accounts; reading needs only a seat.

A question with a deadline — where an instrument lands, guessed from inside the terminal. The gateway fixes the price at the fixation moment, ranks the guesses and credits the places, once per winner and never twice.

What is watched
Watch quotes on this server
Switched off, the watchdog stays loaded and raises nothing.
Which symbols
Only the ones I list
"Everything" re-reads the server's symbol list about once a minute, so a new listing is covered without anyone editing this.
Symbols
nothing listed — nothing watched
EURUSD, XAUUSD...
Default patience
60
seconds without a tick before a symbol counts as stalled
Poll interval
5
how often quotes are read, in seconds
Market closes
Fri 21:00
Market opens
Sun 21:05
nothing is raised over the weekend
Patience by group
Add a rule
A symbol matching one of these gets that threshold instead of the default. Metals tick slower than majors, and one number for both is either noise or blindness.
Tick age, symbol by symbol
read at 2026-09-21 16:03, refreshed every 15s
State

BI Dashboard
This brokerage's whole business on one screen: who is trading, what went through, what came in and what went out, what the book is carrying, and what every module on the gateway did. Every figure names the backend read it came from; a figure this server cannot supply is drawn as a dash with the reason, never as a zero. Nothing here changes anything on the trading server.

Reporting & Analytics
Every report the gateway can honestly produce from the book: trading, clients, money, risk, and whichever modules run on it. Pick one, cut it, filter it, page through it, export it. Each names the backend read it came from, and a read the gateway could only do in part says so above the table. Nothing here changes anything.

Group & Symbol Manager · Symbol Creator
Read, edit and diff a symbol as the document a broker's server actually holds — every field, with the changes named before they are written, to one named installation.
WHAT IT IS WAITING FOR
Needs the symbol write endpoints on each broker's manager API, and an Estate Operation to write the same change to several.
Not built here yet. Nothing on this screen is a stand-in for data — when it is ready it will read the estate the way every screen beside it does.

MT4 Archiving Tool
Group & Symbol Manager · Archiving
Archive dormant accounts and the history behind them on a rule — what qualifies, what it frees on each installation, and how to bring one back.
WHAT IT IS WAITING FOR
Needs an MT4 server on the installation and the archive endpoints on its bridge.
Not built here yet. Nothing on this screen is a stand-in for data — when it is ready it will read the estate the way every screen beside it does.

Dynamic Leverage
TestHonorProHub Brokerage — leverage that falls as a position grows, and falls further before the market gets dangerous: its ladder by open volume, windows that cap it around a release or the weekend gap, and the record of every account this moved. Every change here is this one broker's.

Journal
Book default
from the gateway
High leverage up to a size, less above it. The steps have to go up in volume and down in leverage, and the last one has to be open-ended — a ladder with a hole in it silently leaves an account on whatever it already had. An empty list is legal and means "no ladder"; it never means leverage zero.
Publish to clients
Off
Note
what this ladder is for
Published, the terminal can answer "why is my leverage 1:100 today" without a support ticket.
Open volume
Leverage
No book-wide ladder yet. Until there is one, applying by tiers is refused rather than guessed at.
+ Add a step
Per instrument class
Keyed by the category the symbol catalogue reports — Forex, Metals, Crypto. Every ladder with something to say answers and the lowest answer is applied: fifty lots of EURUSD and fifty lots of Bitcoin are not the same risk, an MT5 account is one number, and the honest number is the one the riskiest part of the book earns.
Add a class ladder
Crypto

Bonus & Credit Manager
Deposit and welcome campaigns, the MT5 credit they hand out, the traded volume that turns that credit into the client's own balance, and the two calls a payout makes on the way past — for the broker selection in the bar above. With several brokers the figures are summed and a broker that could not be read is named, never counted as zero; with one, this is that broker's desk, and everything that moves money is previewed, keyed and confirmed there.

Notifications
A component of this console's brokerage, with its connectors.
shipping
licence unknown
No screen in this console yet
This component runs on the brokerage side. Everything below is what this authority knows about it today; when its console screen ships, this menu entry opens it instead.
What it is
Every channel the platform can reach a client on. A channel is a setting of this component, not a component of its own — the catalogue prices them separately because their transports cost differently.

gateway reachable
Brand
X Trader
#daff1f
A white-label document has been delivered to this gateway and the terminal is serving under it. Clients see this name and these colours.
Last published
v1
never published through the admin door
The terminal configuration the gateway is serving, by its own version and stamp.
Licence
in licence
Whether TestHonorProHub Brokerage's signed licence carries web-terminal. Changed on the tenant's own page, never here.
Two ways it can be down
The door on the left asks the surface's own address from the outside — that is whether a client can load the page. The gateway figures come from the inside and say whether the server behind it is answering. Either can fail on its own, which is why this screen does not roll them into one green dot.

Publishing
source · allowlist · how to consume
Publishing
updated — by —
The feed is on
Off is the default of a fresh install: every consumer endpoint answers 404 disabled until this is switched on. Turning it off again closes every consumer endpoint on the next request, streams in flight included.
Source
raw — the dealer-side MT5 quote
Shaped lays the Price Feed Jammer's markup over the quote if that module is enabled and reachable — otherwise it falls back to raw rather than go dark.
Most symbols / request
50
1 to 500 — so one call cannot read the whole book and call it a snapshot.
What a key may read is the allowlist below (empty = the whole book) narrowed by the key's own scope. A symbol outside either is a 403.
Published allowlist
empty — the whole book is published
EURUSD
Add symbol
No allowlist, so every symbol we run is published. Add one to narrow it.

MAM
A mandate is a manager's authority over a set of our client accounts — the master they follow, how each account's size is derived from his trades, and what he is paid for running it. The copying is the copy engine's; a mandate is the policy over it, and only a push reaches anybody's account.

Trading contests across the estate: a metric, a window, an entry rule and a prize table — for the broker selection in the bar above. With several brokers the figures are summed and a broker that could not be read is named, never counted as zero; with one, this is that broker's contest desk, where scores are measured against equity frozen at the start and the prizes are paid — once, after a rehearsal.

Prediction Campaigns
A question with a deadline — where an instrument lands — answered from inside the terminal, for the broker selection in the bar above. With several brokers the figures are summed and a broker that could not be read is named, never counted as zero; with one, this is that broker's desk, where at the fixation moment the price is read, the guesses ranked and the places credited: once per winner, and never twice.

The quote-stall watchdog on each broker's server, for the selection in the bar above. When prices stop flowing during market hours that desk is paged, and a recovery notice follows with the measured gap. With several brokers the figures are summed and a broker that could not be read is named, never counted as zero; with one, this is that broker's watchdog — its feed health, its rules and where it pages.

TestHonorProHub Brokerage
The estate's business on one screen: every figure the selected installations' own dealing gateways describe and compute for the same window, consolidated by each figure's own rule — summed where a sum is true, weighted where it is a rate, refused where it is a level. A broker that could not answer is named below — it is never counted as zero. The picker in the module bar decides which brokers this covers.

-5,359 commission · -2,611 swap, as booked on the deals
Clients' realised P&L
-195,698
the book's own result is +195,698 — the same number the other way up, and not revenue
What "the book's result" is, and what it is not
It is the clients' realised P&L negated, and that is the whole of what a manager API can honestly say. Cover taken with a liquidity provider, what that cover cost, and which flow is B-booked are facts on the other side of the wire. Treat this as the first line of a P&L, never as the last one.

EMIR Reporting
Reporting · Regulator Reporting
Build the EMIR trade and position reports from a broker's book, with the fields the trade repository requires, the validation it runs, and a record of every submission.
WHAT IT IS WAITING FOR
Needs the reporting component on the installation, and that broker's LEI and repository credentials on its licence record.
Not built here yet. Nothing on this screen is a stand-in for data — when it is ready it will read the estate the way every screen beside it does.

Saphyte Integration
Reporting · Saphyte Integration
Which installations are wired to Saphyte, what each one syncs — clients, accounts, deposits — and every record the sync refused, with the reason.
WHAT IT IS WAITING FOR
Needs the Saphyte connector on each gateway to report its own state. The Connections desk already reads the CRM lines this installation holds.
Not built here yet. Nothing on this screen is a stand-in for data — when it is ready it will read the estate the way every screen beside it does.

what a licensee buying this component gets
Where partners are managed
No CRM is on record for this brokerage yet, so there is nothing behind this component here at all. Wire one on the tenant card first.
Tenant record →
What 360 can count, and what it cannot
Can
the client book — how many accounts this broker's dealing gateway holds, read one row at a time from /api/admin/clients on the authority's own ticket.
Cannot
clients by partner — an MT5 account carries no partner attribution the gateway publishes, so there is no partner mark to count by. The number above is the whole book, and cutting it by introducing broker is a question only the CRM can answer.
volume or commission by partner — the same reason, twice over: the gateway publishes no per-client deal feed either.
Both absences are worth stating rather than filling in with a plausible figure. A partner-attribution number invented on this side would be argued about with a partner on the phone, and it would lose.
What a licensee gets
This is a component 360 sells. A brokerage that licenses it runs the programme inside their own Hub: partner records with codes, a referral link the console composes, the clients that link brought in, commission plans, and accruals paid either through the money desk or by hand onto a partner's trading account.
That is their installation's screen, not this one. This console is the licence authority for it and the estate's connectors — two jobs, and neither of them is being a partner book.

The client-feature document the gateway is serving, by its own version and stamp.
Licence
in licence
Whether TestHonorProHub Brokerage's signed licence carries trader-cabinet. Changed on the tenant's own page, never here.
Two ways it can be down
The door on the left asks the surface's own address from the outside — that is whether a client can load the page. The gateway figures come from the inside and say whether the server behind it is answering. Either can fail on its own, which is why this screen does not roll them into one green dot.

What the gateways say their numbers do not cover
TestHonorProHub Brokerage: This server's client book carries no margin figure, so margin usage is empty rather than zero. The Risk Dashboard reads margin one account at a time and this screen will not add a whole-book per-account read to a panel that refreshes every minute.
